

Chapter 15 – Skin and subcutaneous tissue

When skin lesions are removed, either by excision biopsy or wide excision, the resulting defect can usually be closed by primary suture. Therefore, our view is that the primary closure is part and parcel of the procedure used to remove the skin lesion.

When Mohs' micrographic surgery is carried out, the resulting defect is normally of a size and shape that cannot be closed by a primary suture and so it is usual for a small skin graft or local flap to be used. Our fee allowance for the primary Mohs' procedure includes an additional amount for a flap closure.

Where the lesion being removed is in a site which causes significant clinical problems, we may allow an additional fee to be charged to reflect this on receipt of a detailed medical report.

Many excisions or excision biopsies are performed under local anaesthesia. This is part and parcel of the primary procedure and additional fees should not be charged. The fee allowed for anaesthesia is for the care of an unconscious or semi-conscious patient during surgery and not for the simple administration of an injection.

Codes for the removal of malignant lesions should only be used where the malignant lesion is removed with a margin of normal tissue and the malignancy is confirmed by the histology report.
